**Edited by**

**HARLYN O. HALVORSON, RICHARD HANSON, AND  
L. LEON CAMPBELL**

A publication comprising the papers presented at the Fifth International Spore Conference, held at Fontana, Wisconsin, 8-10 October 1971.

This book contains reviews as well as reports of original and basic research in eight related areas of interest regarding spores.

1. Structure and chemical nature of spores.
2. Genetics of spore forms.
3. Biochemical changes during sporulation:  
Sporulation-related events.
4. Regulation of macromolecular synthesis during  
sporulation and outgrowth.
5. Ecology of spore forms.
6. Immunology of spores and spore forms.
7. Cryptobiosis: Dormancy and its alterations.
8. Biochemical mechanisms of germination.

This book will serve as a valuable resource book for investigators, teachers, students, industry, and libraries.

*It is characteristic of the progress . . .*

of science that new knowledge in a particular field of study fosters greater interest which, in turn, is followed by further discovery. This is the spiral of scientific progress and, sooner or later, the new information being acquired demands a regular medium for communication.

This has now happened with research in the field of antimicrobial agents and chemotherapy. Up until recently, the American Society for Microbiology's annual publication kept up with major activity in the field. But new advances in the area are now too numerous to be adequately presented only once a year. Consequently, beginning in January 1972, the Society will publish a monthly interdisciplinary journal devoted to the dissemination of knowledge relating to all aspects of antimicrobial agents and chemotherapy, including cancer chemotherapy.

# MANUAL OF CLINICAL MICROBIOLOGY

Edited by JOHN E. BLAIR, Department of Microbiology, The Roosevelt Hospital, New York; EDWIN H. LENNETTE, Viral and Rickettsial Disease Laboratory, California Department of Public Health, Berkeley; and JOSEPH P. TRUANT, Department of Microbiology, Providence Hospital, Southfield, Michigan. With an expert editorial board of 16 members. *Regular edition: \$12.00; Student edition, \$7.00.* Members of the American Society for Microbiology may purchase copies of the regular edition at a discount of 50%, i.e., \$6 per copy (postpaid) by writing directly to the ASM Publications Office, 1913 I Street, N.W., Washington, D.C., 20006.

This manual is designed to be used as a working reference guide in clinical microbiology for the teacher and technologist. It encompasses the fields of clinical bacteriology, mycology, serodiagnosis, virology, and parasitology. Currently accepted and proven methods are presented which permit the complete microbiological examination of clinical specimens. Procedures are given for the isolation and identification of the medically important bacteria, fungi, viruses, and parasites, with emphasis on those organisms which occur most frequently in infection in man, but with adequate consideration of the rarer forms. The manual contains 77 chapters, written by 100 contributors.

General sections describe the collection and processing of specimens, nutritive and environmental requirements of microorganisms, selection and inoculation of culture media for primary isolation, formulas of culture media, reagents and stains, staining procedures, microscopy, quality control, and safety precautions.

Contents By Section: General. Identification of Aerobic Bacteria. Identification of Anaerobic Bacteria. Antimicrobial Agents. Serodiagnosis of Bacterial and Spirochetal Infections. Identification of Fungi. Identification of Parasites. Identification of Viruses and Rickettsiae. Miscellaneous Procedures. Media, Procedures, Reagents, and Stains.
